There are several classes of “systemitem”:

```
<systemitem>systemitem</systemitem>
<systemitem class="daemon" xml:id="daemon">daemon systemitem</systemitem>
<systemitem class="domainname" xml:id="domainname">domainname systemitem</systemitem>
<systemitem class="etheraddress" xml:id="etheraddress">etheraddress systemitem</systemitem>
<systemitem class="event" xml:id="event">event systemitem</systemitem>
<systemitem class="eventhandler" xml:id="eventhandler">eventhandler systemitem</systemitem>
<systemitem class="filesystem" xml:id="filesystem">filesystem systemitem</systemitem>
<systemitem class="fqdomainname" xml:id="fqdomainname">fqdomainname systemitem</systemitem>
<systemitem class="groupname" xml:id="groupname">groupname systemitem</systemitem>
<systemitem class="ipaddress" xml:id="ipaddress">ipaddress systemitem</systemitem>
<systemitem class="library" xml:id="library">library systemitem</systemitem>
<systemitem class="macro" xml:id="macro">macro systemitem</systemitem>
<systemitem class="netmask" xml:id="netmask">netmask systemitem</systemitem>
<systemitem class="newsgroup" xml:id="newsgroup">newsgroup systemitem</systemitem>
<systemitem class="osname" xml:id="osname">osname systemitem</systemitem>
<systemitem class="process" xml:id="process">process systemitem</systemitem>
<systemitem class="protocol" xml:id="protocol">protocol systemitem</systemitem>
<systemitem class="resource" xml:id="resource">resource systemitem</systemitem>
<systemitem class="server" xml:id="server">server systemitem</systemitem>
<systemitem class="service" xml:id="service">service systemitem</systemitem>
<systemitem class="systemname" xml:id="systemname">systemname systemitem</systemitem>
<systemitem class="username" xml:id="username">username systemitem</systemitem>
```
